

## Comments

The results on the final exam were very good. A summary of average score per problem is shown below. In Question 2(a), the scores were a bit lower than expected, as many did not use the direct definition of a eigenvector, which would lead to a much shorter computation than the indirect method used by many candidates. Question 1(c) also had a quite low score. This was more in line with expectations, as it is a more difficult problem.

## Average score per problem

- Question 1: a) $92 \%$ b) $78 \%$ c) $31 \%$
- Question 2: a) $63 \%$ b) $78 \%$ c) $60 \%$
- Question 3: a) $84 \%$ b) $60 \%$ c) $61 \%$
- Question 4: a) $84 \%$ b) $57 \%$ c) $57 \%$
- Question 5: $18 \%$ (extra credit)
