## Problem Sheet 10 DRE 7007 Mathematics

BI Norwegian Business School

## Problems

**1.** We consider the function  $f: D \to \mathbb{R}$  on  $D = (1, \infty) \subseteq \mathbb{R}$ , given by

$$f(x) = \frac{1}{2}\left(x + \frac{a}{x}\right)$$

where  $a \in \mathbb{R}$  is a given number.

- a) Show that *f* defines an operator  $f: D \to D$  if  $a \in (1,3)$ .
- b) Show that f is a contraction and find its fixed point for each  $a \in (1,3)$ . What about a = 1 and a = 3?

c) Is *D* complete?

**2.** Consider the correspondence  $F : [0,2] \rightarrow [0,2]$  given by

$$F(x) = \begin{cases} \{2\} & x \in [0,1) \\ \{0,2\} & x = 1 \\ \{0\} & x \in (1,2] \end{cases}$$

Describe the graph of F. Does Kakutani's Theorem apply? Does F have any fixed points?

Keep answers as short and to the point as possible. Answers must be justified.
