I came to the position that mathematical analysis is not one of the many ways of doing economic theory: it is the only way.

R. Lucas

Lecture 21 – 22 Sec. 7.12, 6.4, 9.3, 9.5: l'Hôpital's rule. Marginal revenue and cost.

Here are recommended exercises from the textbook [SHSC].

Section **7.12** exercise 1-3, 4a, 5 Section **6.4** exercise 2, 6 Section **9.5** exercise 1-4

Problems for the exercise session Wednesday 8 Nov. 12–17+ in D1-065

Problem 1 Compute the limit values.

a)
$$\lim_{x \to 3} \frac{-x}{25(x-1)}$$
 b) $\lim_{x \to \ln 5} \frac{e^x - 5}{x^2 - 5}$ c) $\lim_{x \to \ln 5} \frac{e^x - 5}{x^2 - (\ln 5)^2}$
d) $\lim_{x \to 0} \frac{7x}{e^x - 1}$ e) $\lim_{x \to 0} \frac{x^{10}}{e^x - 1}$ f) $\lim_{x \to 1} \frac{x \ln(x)}{x^2 - 1}$
g) $\lim_{x \to 1} \frac{\ln(x)}{e^{2x} - e^2}$ h) $\lim_{x \to 1} \frac{\ln(x)}{\sqrt{x} - 1}$ i) $\lim_{x \to 2} \frac{e^{x^2 - 3x + 2} - 1}{x^2 - 4}$

Problem 2 Compute the limit values by applying l'Hôpital's rule.

a)
$$\lim_{x \to \infty} \frac{-x}{25(x-1)}$$
 b) $\lim_{x \to 1} \frac{\ln(x)}{2x-2}$ c) $\lim_{x \to \infty} \frac{x^2 - 4x + 10}{e^x - 5}$ d) $\lim_{x \to \infty} \frac{\ln(x)}{x}$

Problem 3 Explain why C(x) is a cost function by checking the three criteria:

(1) C(0) > 0

(2) C(x) is an increasing function

(3) C(x) is a convex function

Determine the cost optimum and the average cost per unit at cost optimum (also called *the minimal unit cost* or *the optimal unit cost*).

a)
$$C(x) = 0.01x^2 + 8x + 2500, x \ge 0$$

b) $C(x) = 0.05(x + 200)^2, x \ge 0$
c) $C(x) = 400e^{0.001x^2}, x \ge 0$
d) $C(x) = 50x + 1000, 0 \le x \le 1000$

Problem 4 C(x) is the cost function, R(x) is the revenue function and x is number of produced and sold units. Determine the profit maximising number of units.

a) $C(x) = 0.01x^2 + 8x + 2500$ and R(x) = 100x for $x \ge 0$

b) $C(x) = 0.005x^2 + 20x + 30000$ and R(x) = 50x for $0 \le x \le 2000$

Problem 5 I figure 1 you see the graph of four different cost functions.

- a) Order the cost functions from the one with the smallest minimal unit cost to the one with the largest minimal unit cost.
- b) Find an approximate value for the cost optimum for each of the cost functions.
- c) Find an approximate value for the minimal unit cost for each of the cost functions.

Figure 1: Four cost functions $(K_1 - K_4)$

Problem 6 (Multiple choice exam 2017s, problem 4)

A firm has the cost function $C(x) = 205x^3 - 120x^2 + 2000x + 2800$ when $x \ge 0$. What is the minimal average unit cost?

- (A) 2 kr
- (B) 12 kr
- (C) 3980 kr
- (D) 7960 kr
- (E) I choose not to answer this problem.

Problem 7 (Multiple choice exam 2016a, problem 14) We consider the limit value

$$\lim_{x\to\infty}\frac{1-x\ln(x)}{e^x}$$

What is true?

- (A) The limit value does not exist
- (B) The limit value equals 1
- (C) The limit value equals $-\frac{1}{2}$
- (D) The limit value equals 0
- (E) I choose not to answer this problem.

Runar Ile

Problem 8 (Multiple choice exam 2015a, problem 15)

We consider the limit value

$$\lim_{x \to 1} \frac{\ln(x) - x + 1}{x^2 - 2x + 1}$$

What is true?

- (A) The limit value does not exist
- (B) The limit value equals 0
- (C) The limit value equals 1
- (D) The limit value equals $-\frac{1}{2}$
- (E) I choose not to answer this problem.

Problem 9 (Multiple choice exam 2018a, problem 14)

We have a curve implicitly defined by the equation $4x^2 - 7xy + 4y^2 = 16$. Which statement is correct?

- (A) There is only one point on the curve with *x*-coordinate 4 and the slope of the tangent at this point is equal to -1
- (B) There are two points on the curve with *x*-coordinate 4 and the product of the slopes of the tangents at these points is -2,75
- (C) There are two points on the curve with *x*-coordinate 4 and the product of the slopes of the tangents at these points is -64
- (D) There are two points on the curve with *x*-coordinate 4 and the product of the slopes of the tangents at these points is $\frac{1024}{425}$
- (E) I choose not to answer this problem.

Answers

Problem 1

a) $\frac{-3}{25(3-1)} = -0.06$	b) 0	c) $\frac{5}{2 \ln 5}$
d) 7	e) 0	f) 0.5
g) $\frac{1}{2e^2}$	h) 2	i) $\frac{1}{4}$

Problem 2

a) $\frac{-1}{25}$	b) $\frac{1}{2}$	c) $\lim_{x \to \infty} \frac{2}{e^x} = 0$	d) 0
		e e	

Problem 3

- a) C(0) = 2500 > 0, C'(x) = 0.02x + 8 > 0 for x > 0 and so C(x) is an increasing function for $x \ge 0$, C''(x) = 0.02 > 0 and so C(x) is a convex function for $x \ge 0$. Cost optimum x = 500gives minimal unit $\cot A(500) = 18$
- b) C(0) = 2000 > 0, C'(x) = 0.1x + 20 > 0 for x > 0 and so C(x) is a increasing function for $x \ge 0$, C''(x) = 0.1 > 0 and so C(x) is a convex function for $x \ge 0$. Cost optimum x = 200 gives minimal unit $\cot A(200) = 40$
- c) C(0) = 400 > 0, $C'(x) = 0.8xe^{0.001x^2} > 0$ for x > 0 and so C(x) is an increasing function for $x \ge 0$, $C''(x) = 0.8(1 + 0.002x^2)e^{0.001x^2} > 0$ and so C(x) is a convex function for $x \ge 0$. Cost optimum x = 22.36 gives minimal unit cost A(22.36) = 29.49
- d) C(0) = 1000 > 0, C'(x) = 50 > 0 and so C(x) is an increasing function for $x \ge 0$, $C''(x) = 0 \ge 0$ and so C(x) is a convex function for $x \ge 0$. Cost optimum x = 1000 gives minimal unit cost A(1000) = 51

Problem 4

- a) For x = 4600 the marginal cost equals the marginal revenue and $\pi''(x) = -0.02 < 0$ gives that the profit function is concave and hence x = 4600 is maximising the profit.
- b) For x = 3000 the marginal cost equals the marginal revenue, but this is outside the domain of definition for the modell. We see that $\pi'(x) = 30 - 0.01x$ is positive for x < 3000 which gives that the profit function is increasing for x in the interval [0, 2000] and hence x = 2000 is maximising the profit.

Problem 5

a) K_4, K_1, K_3, K_2

- b) $K_4: x = 220, K_1: x = 120, K_3: x = 270, K_2: x = 40$ c) $A_4(220) = \frac{112}{220} = 0.51, A_1(120) = \frac{65}{120} = 0.54, A_3(270) = \frac{165}{270} = 0.61, A_2(40) = \frac{35}{40} = 0.88$
